COUNTDOWN TO PROGRESS 1998

Data presented in *Countdown to Progress 1998* examines the health status of selected statistics for Tennessee by county over the past decade. Also presented is data for Tennessee and the United States for the *National Health Promotion and Disease Prevention Objectives* for the year 2000, and comparative United States data for 1996. Several graphs are also included that look back at Tennessee's population, birth, and death trends during the past century.

In 1991, the Public Health Service of the U.S. Department of Health and Human Services published *Healthy People 2000: National Health Promotion and Disease Prevention Objectives*. That report was intended to assist both health providers and consumers in addressing measurable targets to be achieved by the year 2000. The data contained in this report updates Tennessee rates for selected indicators for births, deaths, and selected diseases.

When comparing national and state data, an average of several years of statistics alleviates the problem of yearly fluctuations in rates. Thus, the data in this report compares 1991-1993 averages with 1996-1998 averages of Tennessee rates. The national objective for the year 2000 is also given for each selected indicator. Please note that a three-year average rate of 0.0 indicates there was an event for that time period, but the average rate was less than 0.5. A dash (-) for an event means there were no events for that time period. Age-adjusted rates were used for the national objectives selected cause of death indicators in this report. The age-adjustment methodology adjusts to the 1940

U.S. standard population, as used by the National Center for Health Statistics.

The population used to calculate the rates in this report was obtained from the Bureau of the Census. The 1991-1998 population estimates for Tennessee were based on estimates prepared from the 1990 census by the Department of Sociology at the University of Tennessee in Knoxville. On March 19, 1999, population estimates and projections were revised by Health Statistics and Research. These revised figures were based on updated county total estimates released by the Bureau of the Census, and may result in rates that differ from those previously published.

Beginning with 1979 events, the underlying causes of death were classified using the *Ninth Revision of the International Classification of Diseases*. For the period 1968-1978, data were classified using the *Eighth Revision of the International Classification of Diseases*.

Because the *Ninth Revision* represents some major changes from the grouping of diseases in the *Eighth Revision*, some regrouping of deaths by cause for the years prior to 1979 have been made. In order to fit as nearly as possible the deaths by cause for the years prior to 1979 into the case categories as those for 1979-1998, a correspondence of code numbers for the *Eighth* and *Ninth Revisions* was used. This correspondence is included in this publication. Because of differences in comparability, statistical data from previous revisions of ICD codes for causes of death were not included in this report.

Countdown to Progress 1998 is a simple presentation of the changes in the health status of Tennessee's counties. This publication is intended to show at a glance the progress or lack of progress in selected statistics. The data contained in this publication may be indicative of the health status of an area, but under no circumstance should be regarded as conclusive proof of the absence or presence of a health problem. In areas where there is a small population or there are relatively few events, the reliability of the associated rate is questionable. Please note that rates are presented for each county, but those rates that are unreliable have been marked and should be viewed with caution.

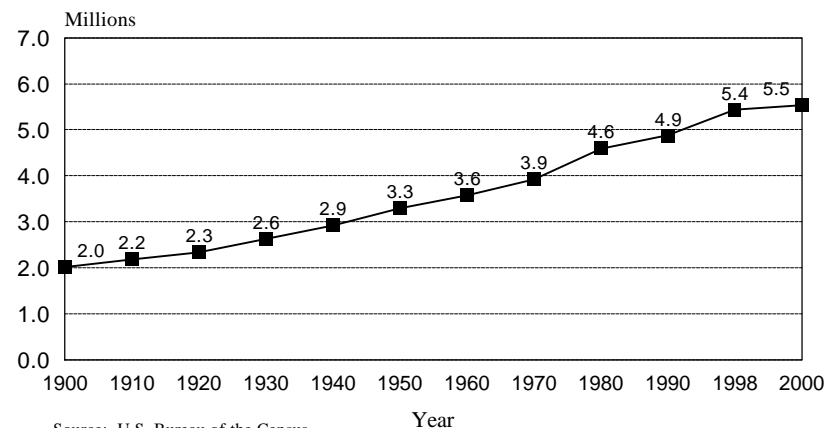

The Department of Health works to promote, protect, and improve the health and well-being of Tennesseans by promoting healthy lifestyles and educating the public on problems that can lead to premature death and disabling diseases. The activities and responsibilities of the Department of Health have changed over the years as the health needs of Tennessee's population have changed.

Epidemics of cholera, yellow fever, and other diseases in the mid-1800's were an influence in the development of public health, and in 1877, Tennessee established a State Board of Health. This board's main activities included combating epidemics, forming county boards of health, working on school sanitation, and maintaining vital records of births and deaths in the state. In 1923, legislation was passed in Tennessee to create a Department of Public Health, which would be in the executive branch of state government.

Over the past century, many public health achievements have been accomplished. Vaccinations have led to the elimination

and control of many infectious diseases, and the control of infectious diseases has also been accomplished through improvements in sanitation and clean water. Fluoridation of drinking water has resulted in the reduction of tooth decay in children and tooth loss in adults. Risk factor modifications, such as smoking cessation and lowering blood cholesterol, early detection, and improved medical technology have contributed to a decline in deaths from heart disease. Increased access to early prenatal care and educating mothers on the importance of good nutrition have resulted in healthier mothers and babies. Safer foods and the discovery of essential nutrients have led to reductions in foodborne infections and nutritional deficiency diseases. The discovery of antibiotics, the implementation of universal childhood vaccination programs, as well as the vaccination of domestic animals against rabies are just some of the numerous public health accomplishments made in the 20th century.

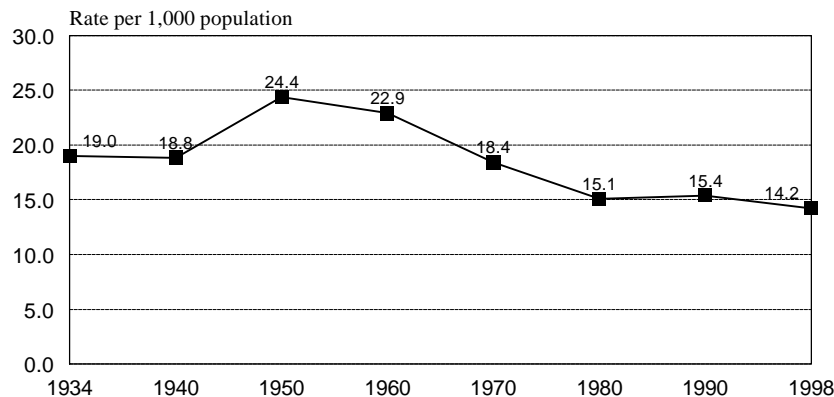

TENNESSEE'S POPULATION GROWTH
1900-2000

In 1900, Tennessee's population was estimated to be 2,020,616, and had increased 63.2 percent to 3,298,605 by 1950. By 1980, the total population had increased to 4,591,120. The estimated 1998 total population for the state was 5,430,621 and is projected to be 5,538,000 by the year 2000. This represents a state population increase of 174.1 percent over the 20th century.

Since the decline in deaths from infectious diseases during the 20th century, Tennessee has seen a decline in the deaths of infants and children. In 1934, Tennessee began keeping vital records on resident births along with the resident and recorded events previously collected, and in that year 12.7 percent of the total resident deaths were to infants, while 18.2 percent of the total deaths were to children under 5 years of age. These percentages have dropped to 1.2 and 1.4 percent respectively in 1998.

LIVE BIRTH RATES
RESIDENT DATA, TENNESSEE 1934-1998

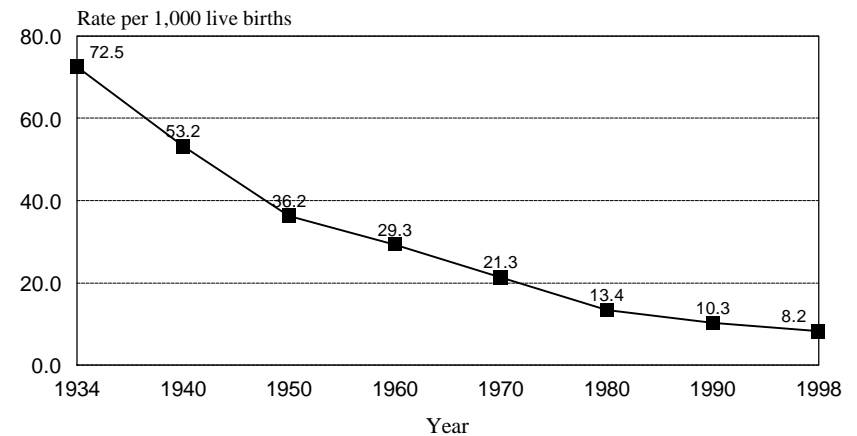

The live birth rate for Tennessee residents increased in 1950 to 24.4 per 1,000 population from a rate of 19.0 in 1934. Since

1950, the birth rate has declined. The rate remained fairly steady from 1980 to 1990 but declined again to 14.2 in 1998.

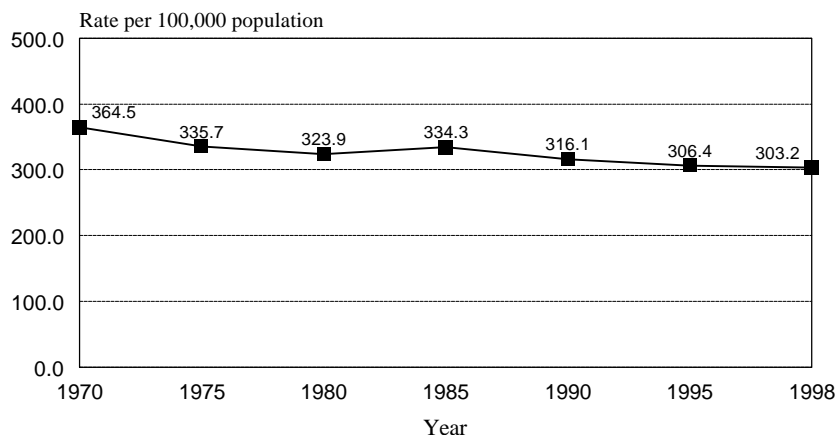

During the 20th century, the infant mortality rate sharply declined. Tennessee's infant mortality rate declined from 72.5 deaths per 1,000 live births in 1934 to a rate of 8.2 in 1998. This was a decrease of 88.7 percent.

INFANT MORTALITY RATES
RESIDENT DATA, TENNESSEE 1934-1998

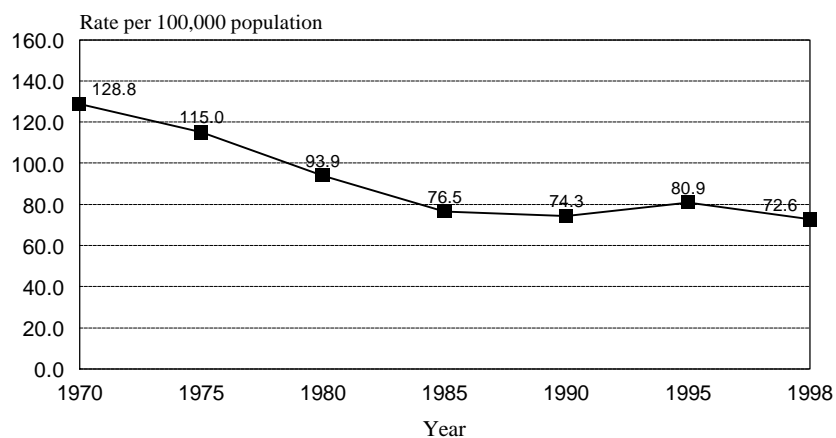

Heart disease was the leading cause of death in Tennessee for most of the 20th century. Prevention efforts, control of high blood pressure and cholesterol levels, and improvements in medical care are just some of the factors which have contributed to the decline in the death rate over the years. In 1998, the crude death rate (303.2) from diseases of the heart decreased 16.8 percent from the rate (364.5) in 1970.

DEATH RATES FROM DISEASES OF THE HEART
RESIDENT DATA, TENNESSEE 1970-1998

The crude death rate for cerebrovascular disease declined 43.6 percent from 128.8 deaths per 100,000 population in 1970

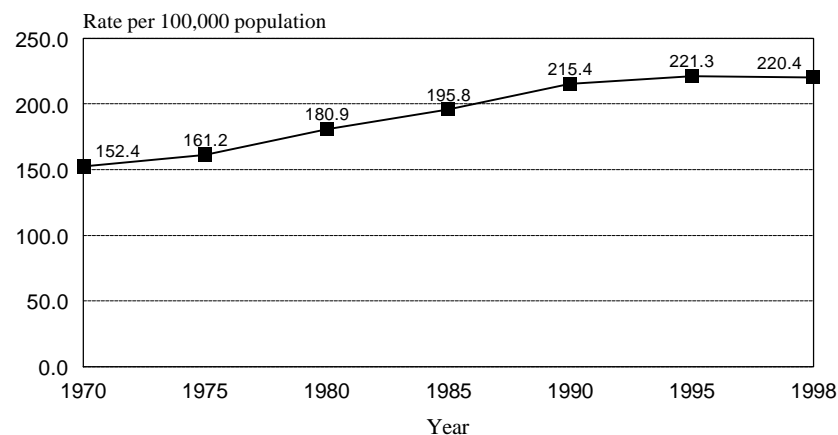

DEATH RATES FROM CEREBROVASCULAR DISEASE
RESIDENT DATA, TENNESSEE 1970-1998

to 72.6 in 1998. Physical activity, smoking cessation, and a healthy diet have been important in reducing the number of cerebrovascular disease deaths over the years.

In 1934, the leading causes of death included diseases of the heart, pneumonia, and tuberculosis. Tennessee's death rate for malignant neoplasms (cancer) increased during the 20th century and in 1998, cancer was the second leading cause of death. Lifestyle, environment, and genetic factor can all increase an individual's risk of developing cancer. The American Cancer Society has estimated that one-half of cancer cases occur

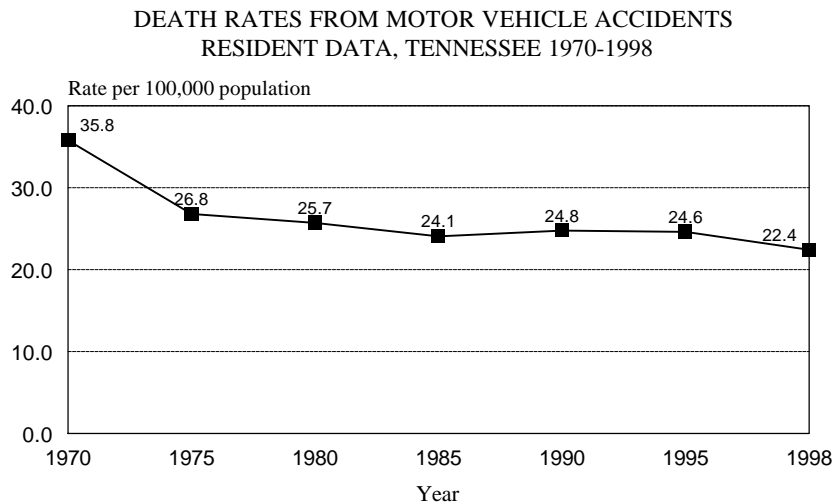

DEATH RATES FROM MALIGNANT NEOPLASMS
RESIDENT DATA, TENNESSEE 1970-1998

in persons 67 years and older. The increased life span of the older population has thus become a contributing factor in the increase of cancer deaths, as this population group is at greatest risk of the developing the disease. The crude death rate for

malignant neoplasms increased from 152.4 per 100,000 population in 1970 to 220.4 in 1998.

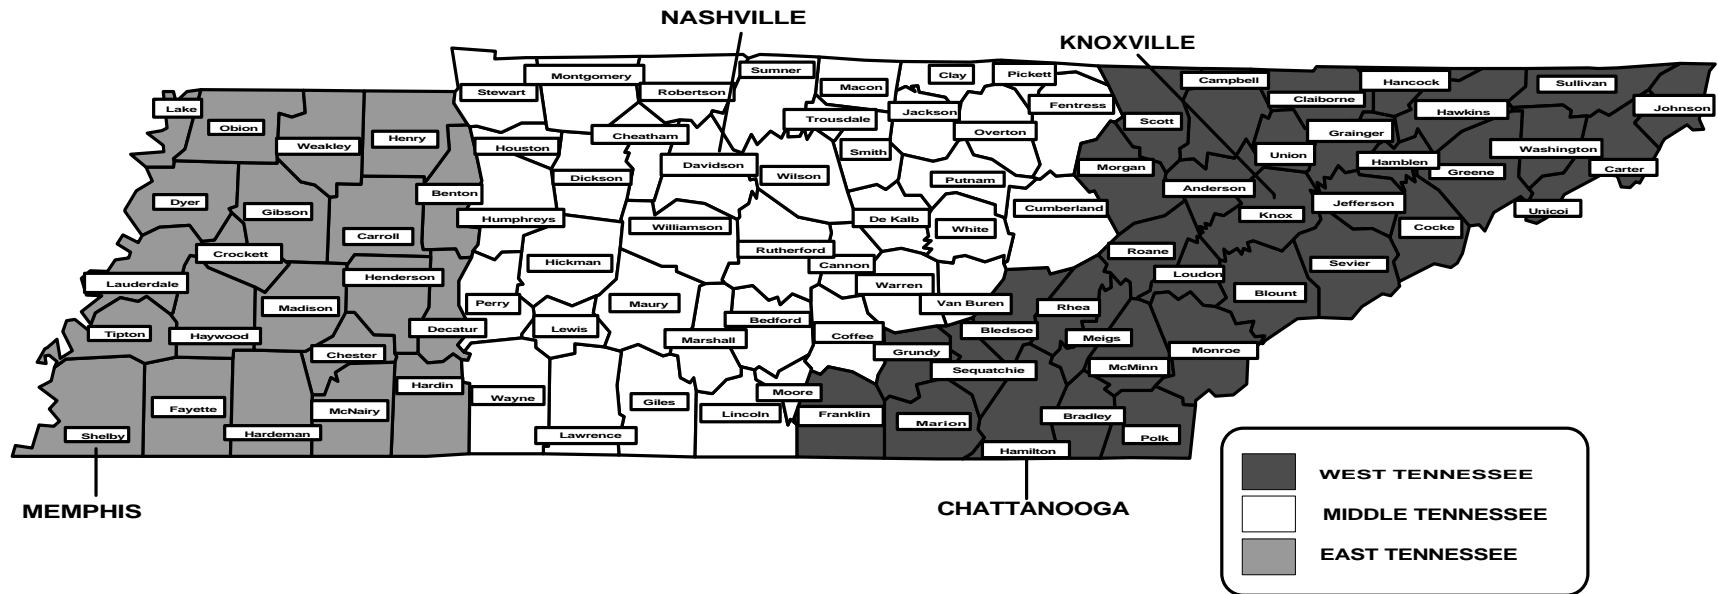

During the 20th century, Tennessee's crude death rate from motor vehicle accidents declined although the number of drivers, the number of motor vehicles, as well as the number of miles traveled in motor vehicles, all increased. Safety belt and child-safety seat usage, enforcement of laws against driving while intoxicated, increased vehicle safety features, and highway improvements are just some of the factors that contributed to this reduction. The death rate from motor vehicle accidents declined from 35.8 in 1970 to 22.4 in 1998.

The public health accomplishments made in the 20th century greatly increased the life expectancy of the state's population and

favorably impacted illnesses and disabling diseases. As Tennessee looks forward to the 21st century, public health faces many different challenges. The appearance of AIDS along with the re-emergence of TB reinforces the importance of disease prevention through continual monitoring of factors that may encourage the emergence or re-emergence of diseases. Anti-smoking campaigns helped to reduce cigarette smoking in adults, but work is still needed to prevent initiation of tobacco use in adolescents. Healthier mothers and babies, reducing adolescent pregnancies, and the importance of nutritional health will all continue to be high priorities. Ongoing research into the reduction of deaths from heart disease, malignant neoplasms, and other chronic diseases is imperative. As public health meets these and many other diverse challenges, Tennessee's countdown to progress will continue into the next century.

DEFINITION OF TERMS AND RATES

Adolescent Pregnancies – The sum of live births, reportable fetal deaths, and reported induced abortions for females 10-17 years of age.

Adolescent Pregnancy Rate – Number of adolescent pregnancies per 1,000 female population aged 10-17. The *Year 2000 National Objective* rate is per 1,000 females aged 15-17 years.

Birth Rate – Number of live births per 1,000 population.

Cause-Specific Death Rate – Number of deaths from a specific cause per 100,000 population. Age-adjusted rates were used for cause-specific death rates. The age-adjustment methodology adjusts to the 1940 U.S. standard population, as used by the National Center for Health Statistics.

Crude Death Rate – Number of deaths per 1,000 population.

Incidence Rate – Incidence rates for tuberculosis, measles, and syphilis are number of cases per 100,000 population. Incidence rates for Acquired Immunodeficiency Syndrome (AIDS) are per 100,000 population 18 years of age and over.

Infant Death – A death of a live-born infant under one year of age.

Infant Mortality Rate – Number of infant deaths per 1,000 live births.

Late Prenatal Care – Late care includes 2nd and 3rd trimester care plus no prenatal care. (Births with prenatal care unknown are excluded.)

Low Birthweight – A live birth weighing less than 2,500 grams (5 pounds, 9 ounces).

Low Birthweight Rate – Number of live births weighing less than 2,500 grams per 100 live births.

Neonatal Death – A death of a live-born infant under 28 days of age.

Neonatal Mortality Rate – Number of neonatal deaths per 1,000 live births.

Recorded Data – Data compiled according to geographic place where the event occurred without regard to residence. (Recorded data for Tennessee include events which took place within the state, irrespective of the residences of the persons to whom the events occurred.)

Resident Data – Data compiled according to the usual place of residence of the person to whom the event occurred without regard to the geographic place where the event occurred. (Resident data for Tennessee include events which occurred to residents of the state irrespective of where the events took place.)

Digestive Organs and Peritoneum	150-159	150-159
Respiratory and Intrathoracic Organs	160-165	160-163, 194.2
Breast	174-175	174
Female Genital Organs	179-184	180-184
Male Genital Organs	185-187	185-187
Diabetes Mellitus	250	250
Diseases of Heart	390-398, 402, 404-429	390-398, 402, 404-429, 450, 782.4
Ischemic Heart Disease	410-414	410-413
Cerebrovascular Disease	430-438	430-438
Atherosclerosis	440	440
Pneumonia	480-486	480-486
Influenza	487	470-474
Chronic Obstructive Pulmonary Disease and Allied Conditions	490-496	490-493, 516.1, 516.2, 518, 519.3

Category Title According To Ninth Revision	International Classification Code Numbers	
	Ninth Revision	Eighth Revision
Hernia and Intestinal Obstruction	550-553, 560	550-553, 560
Chronic Liver Disease and Cirrhosis	571	571
Cholelithiasis and Other Disorders of Gallbladder	574-575	574-575
Nephritis, Nephrotic Syndrome, and Nephrosis	580-589	580-584
Complications of Pregnancy, Childbirth, and the Puerperium	630-676	630-678
Congenital Anomalies	740-759	740-759
Certain Conditions Originating in the Perinatal Period	760-779	760-769.2, 769.4-772, 774-778
Accidents and Adverse Effects	E800-E949	E800-E949
Motor Vehicle Accidents	E810-E825	E810-E823
Suicide	E950-E959	E950-E959
Homicide and Legal Intervention	E960-E978	E960-E978

Beginning with data for 1987, NCHS introduced categories *042-*044 for classifying and coding Human Immunodeficiency Virus (HIV) infection. The asterisks before the category numbers indicate that these codes are not part of the Ninth Revision International Classification of Diseases.

APPENDIX B

SOURCES AND REFERENCES

The birth and death data listed in this report was obtained from birth and death certificates filed with the Department of Health's Office of Vital Records. The Department's Bureau of Health Services was the source for the incidence data on communicable diseases and AIDS cases.

The source for year 2000 National Objectives was *Healthy People 2000 Review 1998-99*.

Other information for this publication was obtained from *Tennessee Blue Book 1997-1998*, the United States Bureau of the Census, *Tennessee Vital Statistics*, published by the Tennessee Department of Health, Health Statistics and Research, and *Morbidity and Mortality Weekly Report*, Vol. 48.

RELIABILITY OF RATES

For the year 2000 National Objective data, this report uses three-year average number of events divided by the three-year average population to alleviate the problem of yearly fluctuation in Tennessee rates. These fluctuations are directly related to the number of events used to calculate the rate. Rates based on small number of events over a specified time period or the small populations vary considerably and should be viewed with caution. A dash (-) for an event means there were no events for that time period. The rate of 0.0 was used when the occurrence of an event resulted in the rate equaling more than zero but less than 0.05. The report also uses "relative standard errors" to assist in interpreting rates on each health status indicator. The relative standard error of a rate describes the rate's reliability in terms of the percentage of the rate's variability. If the variability is greater than 30 percent, the rate is considered unreliable. The reader should note that there could be some rates included in this publication that are not flagged as unreliable, but because they are based on small number of events their reliability is suspect.

CAUSE OF DEATH CODES

This publication uses cause of death codes contained in the *International Classification of Diseases, Ninth Revision (ICD-9)* for the year 2000 National Objectives.

Coronary heart disease	402, 410-414, 429.2
Stroke	430-438
Female breast cancer	174
Lung cancer	162.2-162.9
Motor vehicle accidents	E810-E825
Homicide	E960-E978
Suicide	E950-E959
